

Once you step outside the confinement of the first circle the groundwork does not apply to everything (not not anything) in the second circle.

As you expand your exposure (what you have learned) contradictions occur between the new and old information. Causing Cognitive Dissonance

As you learn new things you're always building on known information, before running, walking, before walking, crawling. Information builds on itself, like words with their roots.

Before continuing humanities endless quest for knowledge you must already know all the information about that subject, you cannot build a car without knowing how an engine works.

You cannot know everything because there would be nothing else to learn.

Some people/scientists expand into unknown information, others refine incorrect basics or groundwork

An endless unknown sea of knowledge. Everything is endless, there isn't a smallest particle, there is no limit to knowledge.

As long as the universe is infinite, so will be the possibilities.
